

## Antibody Identification in RCI

Zahera Miah

HSST

RCI Filton, Bristol

Zahera.Miah@nhsbt.nhs.uk

# The Dosage effect

Dosage - is a phenomenon in which red cells from homozygous people possess more antigens per red cell than cells from heterozygous people.

The effect - antibodies react more strongly with cells from homozygous people

E.g., anti-Jka would likely react stronger with **Jka+ Jkb-** cells (**homozygous** Jka expression) than **Jka+ Jkb+** cells (**heterozygous** Jka expression )

# The Dosage effect

Dosage is mainly associated with antibodies to the  
 Duffy, Kidd, Rh, and MNS blood group systems.

	Rh	M	N	S	s	Other	IAT
1	R <sub>1</sub> <sup>w</sup> R <sub>1</sub>	0	+	0	+		0
2	R <sub>1</sub> R <sub>1</sub>	+	0	+	0		2
3	R <sub>2</sub> R <sub>2</sub>	0	+	0	+		0
4	r'r	+	0	+	0		2
5	r''r	+	0	+	0		2
6	rr	+	+	0	+		0
7	rr	0	+	0	+		0
8	rr	+	0	0	+		2
9	rr	+	0	0	+		2
10	rr	0	+	+	0		0

Anti-M reacting stronger with homozygous cells for the M antigen (M+N-)

Anti-M showing dosage with a heterozygous cell for the M antigen (M+N+)

# Antibody Exclusion

BSH guidelines state:

- The presence of **anti-Jk<sup>a</sup>, anti-Jk<sup>b</sup>, anti-S, anti-s, anti-Fy<sup>a</sup> and anti-Fy<sup>b</sup>** should be excluded using red cells having homozygous expression of the relevant antigen.
- A **single example of each phenotype** is sufficient for exclusion

# Antibody Inclusion

BSH guidelines state:

ANTIBODY SPECIFICITY SHOULD ONLY BE ASSIGNED WHEN

- The plasma is reactive with at least **2 examples** of reagent red cells **expressing the antigen**

AND

- Non-reactive with at least **2 examples** of reagent red cells **lacking the antigen**

**Blood and Transplant**

Now it's your turn...

**Caring Expert Quality**

BMS issued: OPos R1R1, K-, Jka- blood

Was this the right decision?

Anti-E, anti-c and anti-Jka have not been excluded

According to BSH guidelines, we can designate an anti-Jka specificity.

The BMS proceeded to perform an R1R1 panel...

DAT Profile																													
Result																													

DAT = Positive by IgG  
Likely presence of warm autoantibody

Plasma Panreactive  
Autocontrol = Positive

Patient has AIHA  
How do we remove the autoantibody to be able to exclude alloantibodies?

# Adsorptions

## 1. AUTOadsorption

- Patient's OWN red cells mixed with patient plasma
- autoantibody attaches to patient's own red cell
- any alloantibody remains in the plasma

### Problem

- Patient must not be recently transfused
- Patient must have sufficient red cells, a good Hb

Mostly our patient's do not fulfil these criteria, so we must alloadsorb

## 2. ALLOadsorption

- Donor (or commercial) red cells mixed with patient plasma
- donor red cells adsorb autoantibody
- alloantibody remains in adsorbed plasma

### Properties of adsorption cells being used:

- Phenotype matched to patient
- Papain treated

What if we don't know the patient's phenotype? How do we select adsorption cells to use?

Commercial cells ( $OR_1R_1$ ,  $OR_2R_2$  and  $Orr$ ) - designed for adsorptions

Lot Number	Rh	C	D	E	c	e	C <sup>w</sup>	K	Jk <sup>a</sup>	Jk <sup>b</sup>
R405 3597	R <sub>1</sub> R <sub>1</sub>	+	+	0	0	+	0	0	+	0
	<u>rr</u>	0	0	0	+	+	0	+	0	+
R404 all lots	R <sub>2</sub> R <sub>2</sub>	0	+	+	+	0	0	0	+	+

RCl can perform adsorptions with 3 different papain treated adsorption cells:

1. R1R1
2. rr
3. R2R2

At least 1 of these cells must be:

- Jka-
- Jkb-
- K-

RCI require good sample volumes to perform these investigations!

Finally...

test the remaining adsorbed plasma against an antibody ID panel  
by IAT

Hopefully, any clinically significant antibody to a common red cell antigen should remain in (at least) one of the 3 adsorbed plasma!

What's the biggest risk of alloadsorption??

The adsorption cells may adsorb out  
a clinically significant alloantibody  
- Especially a high frequency  
antibody

### 3 Papain treated adsorption cells

An antibody to which blood group system?

Anti-Kpb

## Case Z

**Female neonate** born pale and floppy with underlying jaundice

**Cord blood hb = 42g/L**

**Blood group: Apos,**

**Antibody screen = Negative**

**DAT = 3+ by IgG**

## Mother

**Blood group: Apos**

**Antibody screen: Negative**

**No previous history of blood transfusions**

What are your thoughts?

Consultant suspects HDFN – What further analysis could help your investigation based on serological results?

Eluate performed on neonate sample = Negative

Who could you consider testing next?

Father!

Antibody panel = Negative

Now what?

IAT testing performed:

Maternal plasma vs neonate rbc's = 3+ reaction

Paternal plasma vs neonate rbc's = No reaction

Maternal plasma vs paternal rbc's = 3+ reaction

Tested Maternal plasma vs rare cell panel

Phenotype performed:  
 Father = Wra+,  
 Mother = Wra-,  
 Cord = Wra+

## Case Z

Neonate with severe HDFN caused by anti-Wra

The Wra antigen is a clinically significant antigen in the Diego blood group system and is a rare cause of haemolytic disease of the newborn (HDFN).

During pregnancy, sensitization may occur in a Wra negative mother with a Wra positive neonate

- inherited the Wra antigen from the father.

HDFN can occur in the first pregnancy

Neonate successfully managed with transfusion, phototherapy, and high-dose intravenous immunoglobulin.

Any questions??
